relay.

Help starts here.

A school assistance app built around the first few taps.

DESIGN STATEMENT

RELAY is a school assistance app for students who need help quickly, including those who cannot speak comfortably. The opening screen puts floor selection before the help categories, so students can share a useful location without knowing a room number. They can review the request, contact a teacher or send a message to the school inbox. The prototype demonstrates automatic escalation to the office when a request has no acknowledgement after 30 seconds. A teacher response and an adult arriving are shown as separate steps. Large controls, clear labels and a text-only option guide the phone experience. The school crest and notebook doodles give it a familiar identity, while light travelling through the background waves adds character. Requests and notifications are simulated for this design submission.

A useful location, with fewer decisions.

01 / LOCATION

A floor is enough.

Ground, Floor 1 and Floor 2 have large tap targets. A block, room or map is optional. “Not sure” keeps help available.

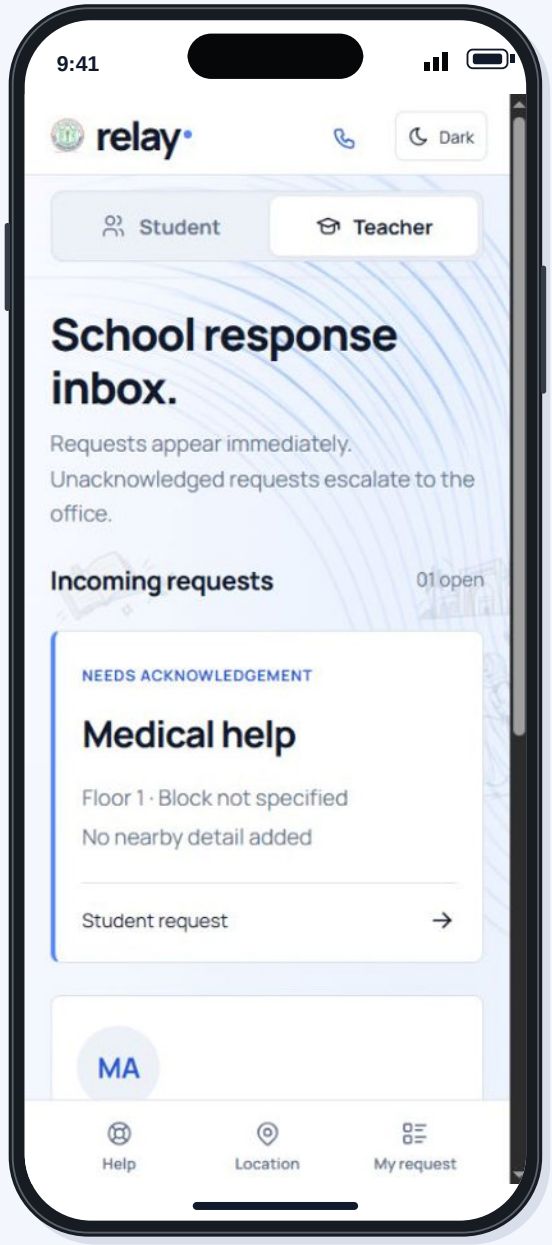

02 / REVIEW

Check, then send.

The request shows the selected help type and location. Back and Edit preserve choices. The Send button stays within reach.

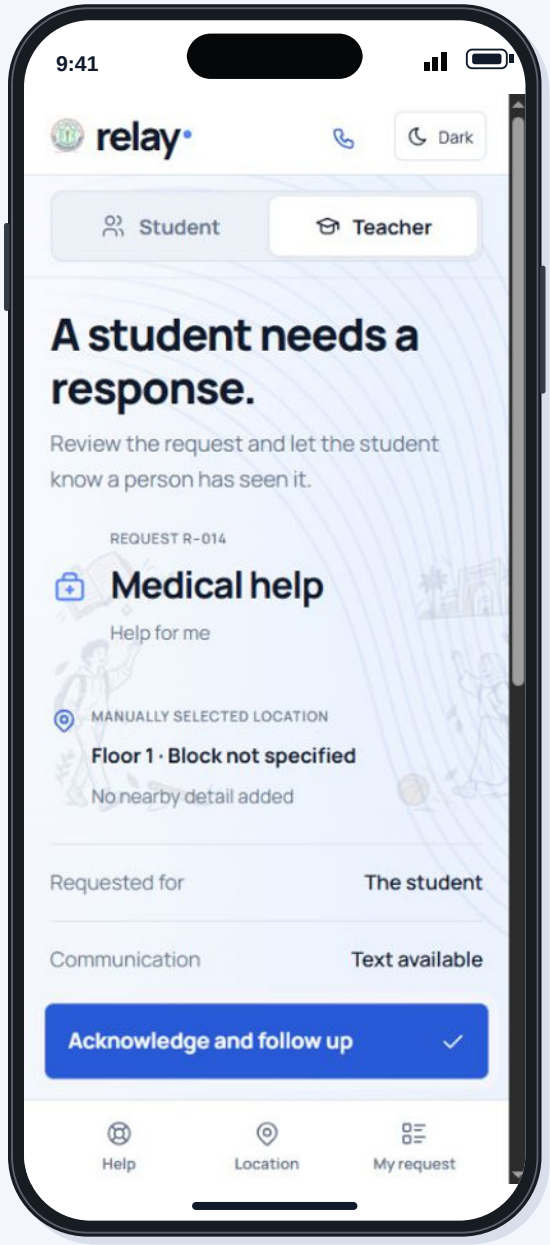

The request reaches a shared inbox.

03 / INBOX

Visible immediately.

A request appears in the shared queue before any individual accepts it. In-app pings are labelled; no SMS or WhatsApp is implied.

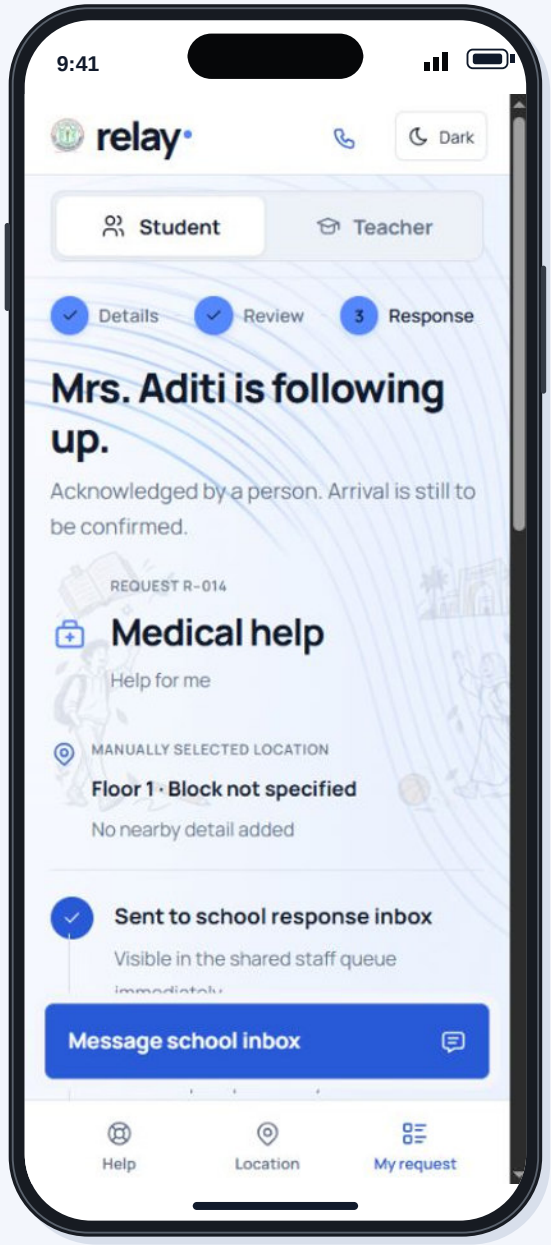

04 / FOLLOW-UP

A person takes responsibility.

Mrs. Aditi can acknowledge the request and reply. Her contact comes from a fixed directory. No live proximity or “nearest teacher” claim is made.

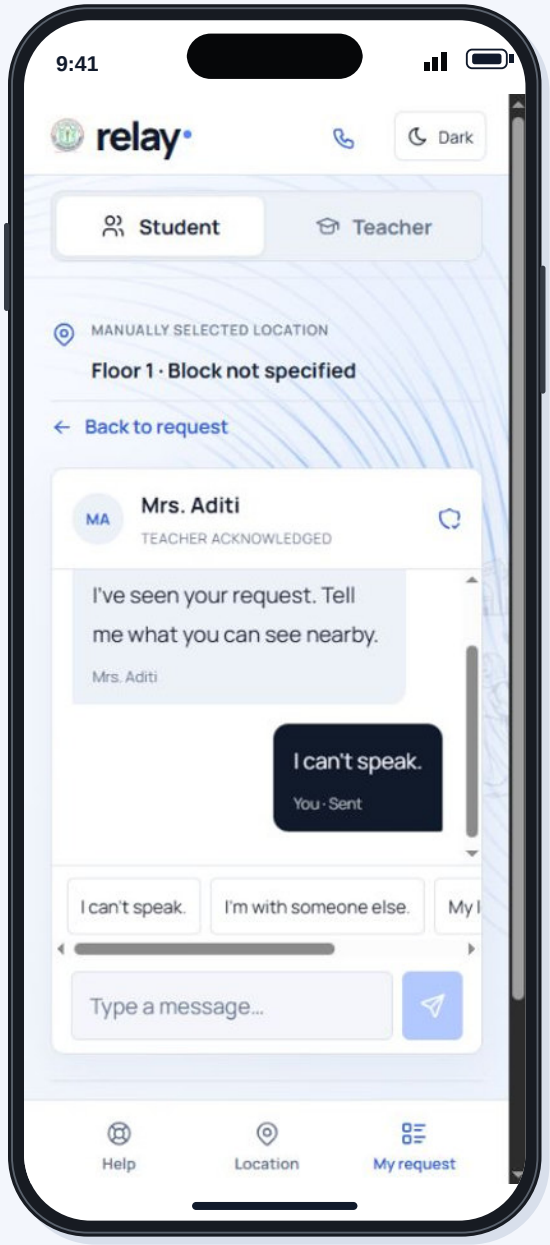

Know what has happened. Keep talking.

05 / STATUS

Acknowledged is a clear state.

The timeline separates delivery, a teacher response and adult handover. Calling and messaging remain available while waiting.

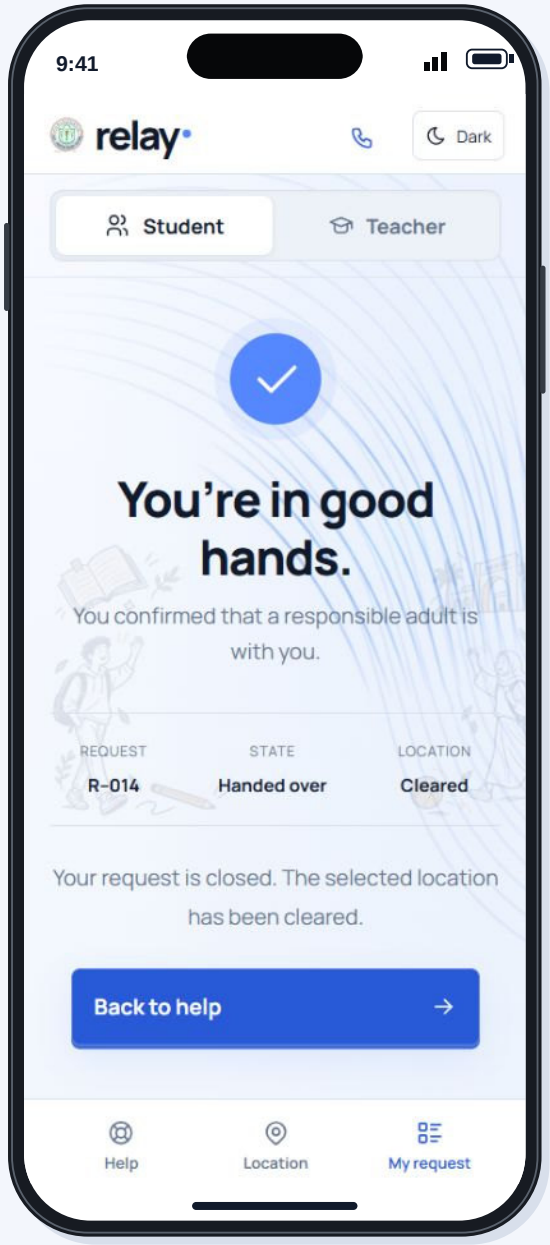

06 / CHAT

Help without speaking.

Quick replies and text support students who cannot speak. Messages can go to the school inbox before a teacher acknowledges.

Close the loop when an adult is there.

07 / HANDOVER

A reply does not mean arrival.

The student confirms that a responsible adult is physically present before closing the request. The selected location is then cleared.

Built for a school day.

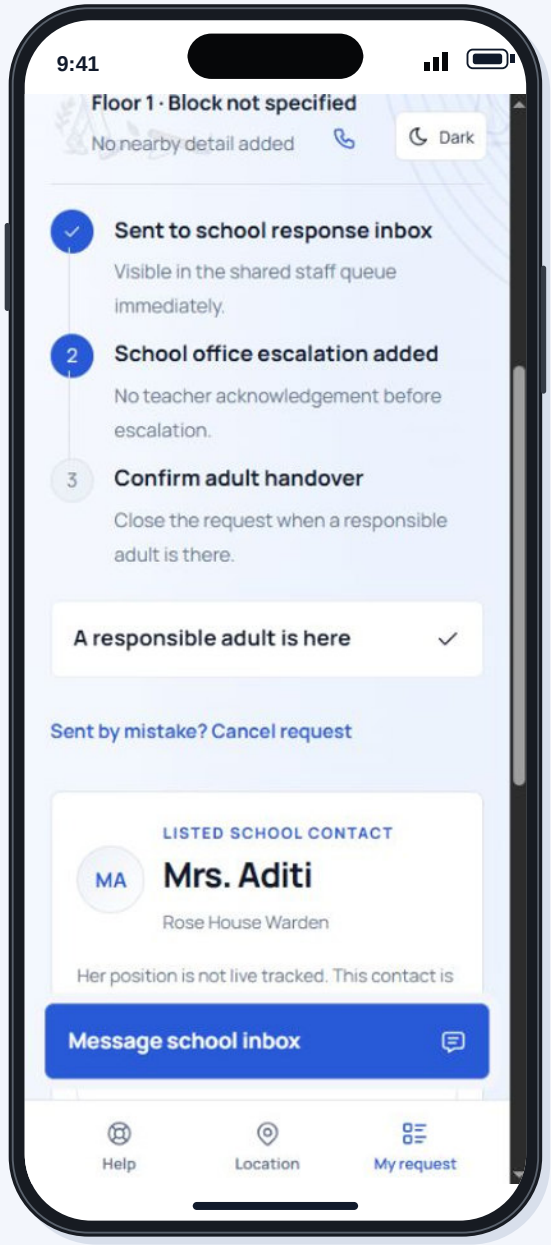

Speed Floor and help type on the opening screen. No account setup in the emergency flow.

Accessibility Large touch controls, readable text, keyboard focus, text-only support and reduced-motion styling.

Identity The school crest, notebook doodles and flowing light along the waves. Decorative motion can be paused.

Phone access Open the link in a browser or add it to the home screen. The desktop layout remains available.

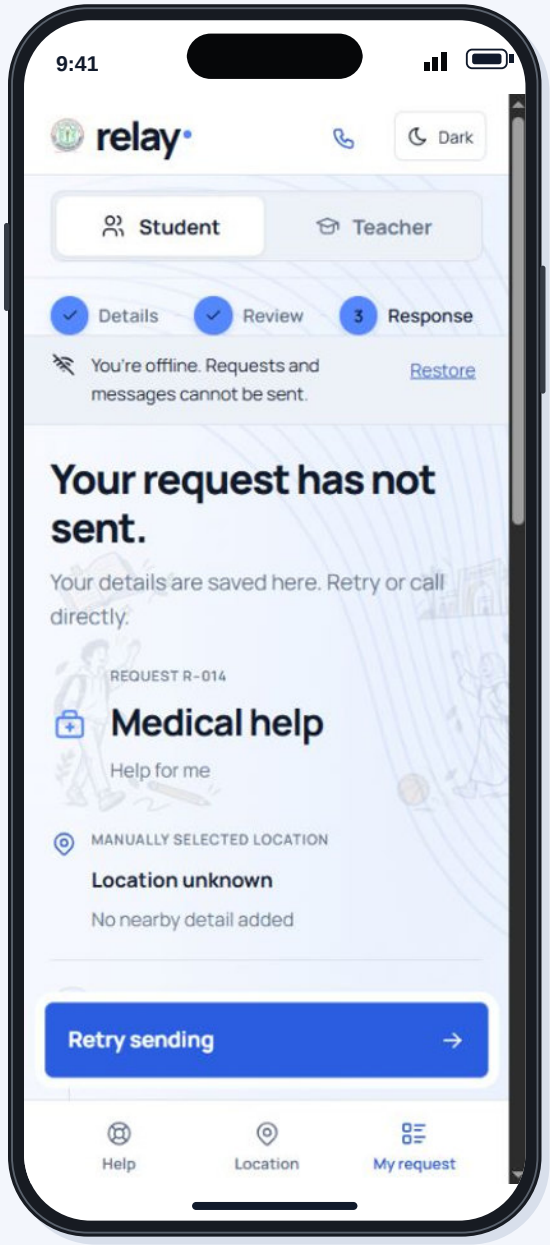

When nobody replies, or the connection fails.

08 / ESCALATION

Follow-up has a deadline.

After 30 seconds without acknowledgement, the prototype adds an office escalation. Students can also escalate immediately and call directly.

09 / CONNECTION LOSS

Unsent stays unsent.

Details remain available for retry. A failed request or escalation is never shown as delivered. The interface can reopen offline after a first visit.

Demonstration: requests, pings and office escalation are simulated. Live delivery and the 30-second policy need school approval.
